

RS6 Cheatarmy Lite

[Instructions](#)

[Download product here](#)

Read the pages below if you have an issue installing the product/using the product.

Here I will go over some common issues users have using R6 and how to fix them.

- Menu Not Showing:

Ensure you're running the DX11 version of R6 and the game is in borderless mode.

Ensure all overlays are off. This includes:

Discord Game Overlay

GeForce Experience Game Overlay

Overwolf Overlay

- Error 700 = Taking Too Long to Load:

To fix this, inject with the game launcher (Steam or Ubisoft) already open. This will cut down on the load time.

- EXC01 = Shut Down PC (Not Restart):

Turn off the PC completely, then turn it back on.

- Menu Still Not Showing:

From a fresh boot, open the game (DX11) without injecting and see if you get a qb update.

If you do, let it install and allow it to restart the game. Once the game has loaded back up, close the game and inject as normal.

You will know injection was done correctly when you get to the main menu you should be seeing this.

I would like to add some information in regards to our provided cleaner.

Do NOT use the cleaner unless you have been banned. The cleaner does absolutely nothing unless you have been banned. It removes traces files that is all.

If you run the cleaner without being banned you risk the chance of corrupting not only the game launcher but game files as well.

If you're reading this because you used the cleaner without being banned and you can no longer login to Ubisoft you will need to reinstall the Ubisoft launcher to fix the issue.

You need to ensure your running dx11 i will explain how to check both below

Open your Steam client and navigate to your game library.

Right-click on Rainbow Six Siege in your game list.

Select Properties from the context menu. This will open the game's properties window.

Ensure you are in the General tab, which should be the default tab when the properties window opens.

In the Launch Options section, click on the dropdown menu.

Select Dx11 from the dropdown options.

for Ubisoft

Open your Ubisoft Connect application.

Navigate to the Library tab to view your game library.

Click on Rainbow Six Siege.

Click the dropdown icon next to the Play button.

Select Play Rainbow Six Siege (dx11) from the dropdown options.

i would like everyone to reboot do not inject open your platform steam or ubi and launch DX11 and see if you get a qb update if you get one let it install once the game restarts close the game you can now try to inject press space when it says complete and launch DX11. You also need to make sure all overlays are off the main ones are listed above.

Also if your on windows 11 23h2 use no spoofer as it can interfere with your connection

and lastly this is personal preference and since i cannot see every users task manager for me i keep everything disabled at startup sometimes there is things there that can also block the menu. If you have done all these steps and are still not seeing the menu then your build is affected and its being worked on. So please try and report back
